Ashe's Juniper Range Map

HISTORIC RANGE OF THE PRAIRIE

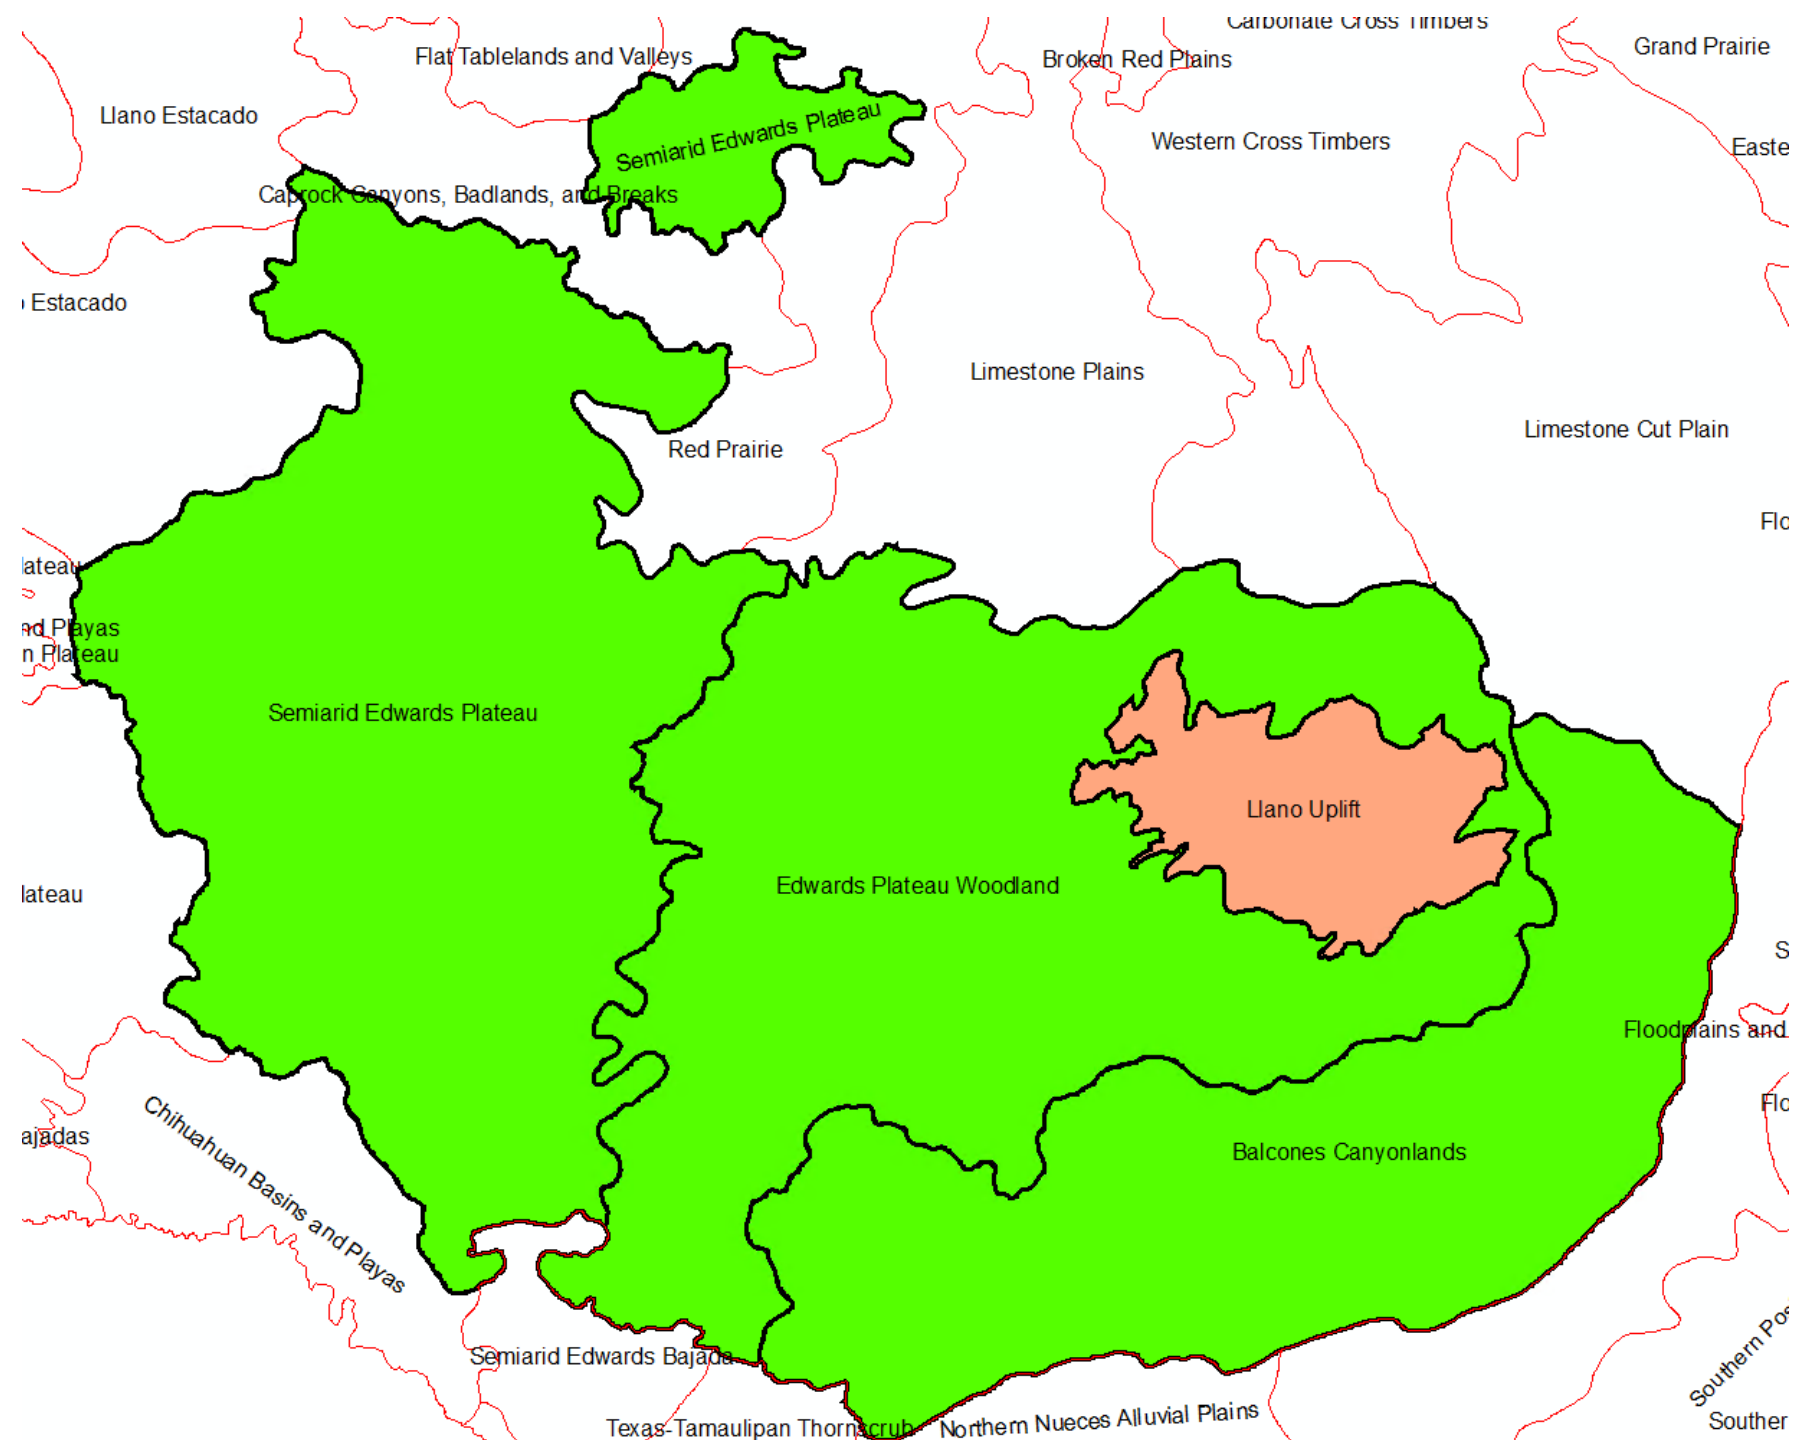

USFS Tree Density

EPA Level 3 Edwards Plateau
Ecoregion (colored area)

Level 4 Ecoregions labeled

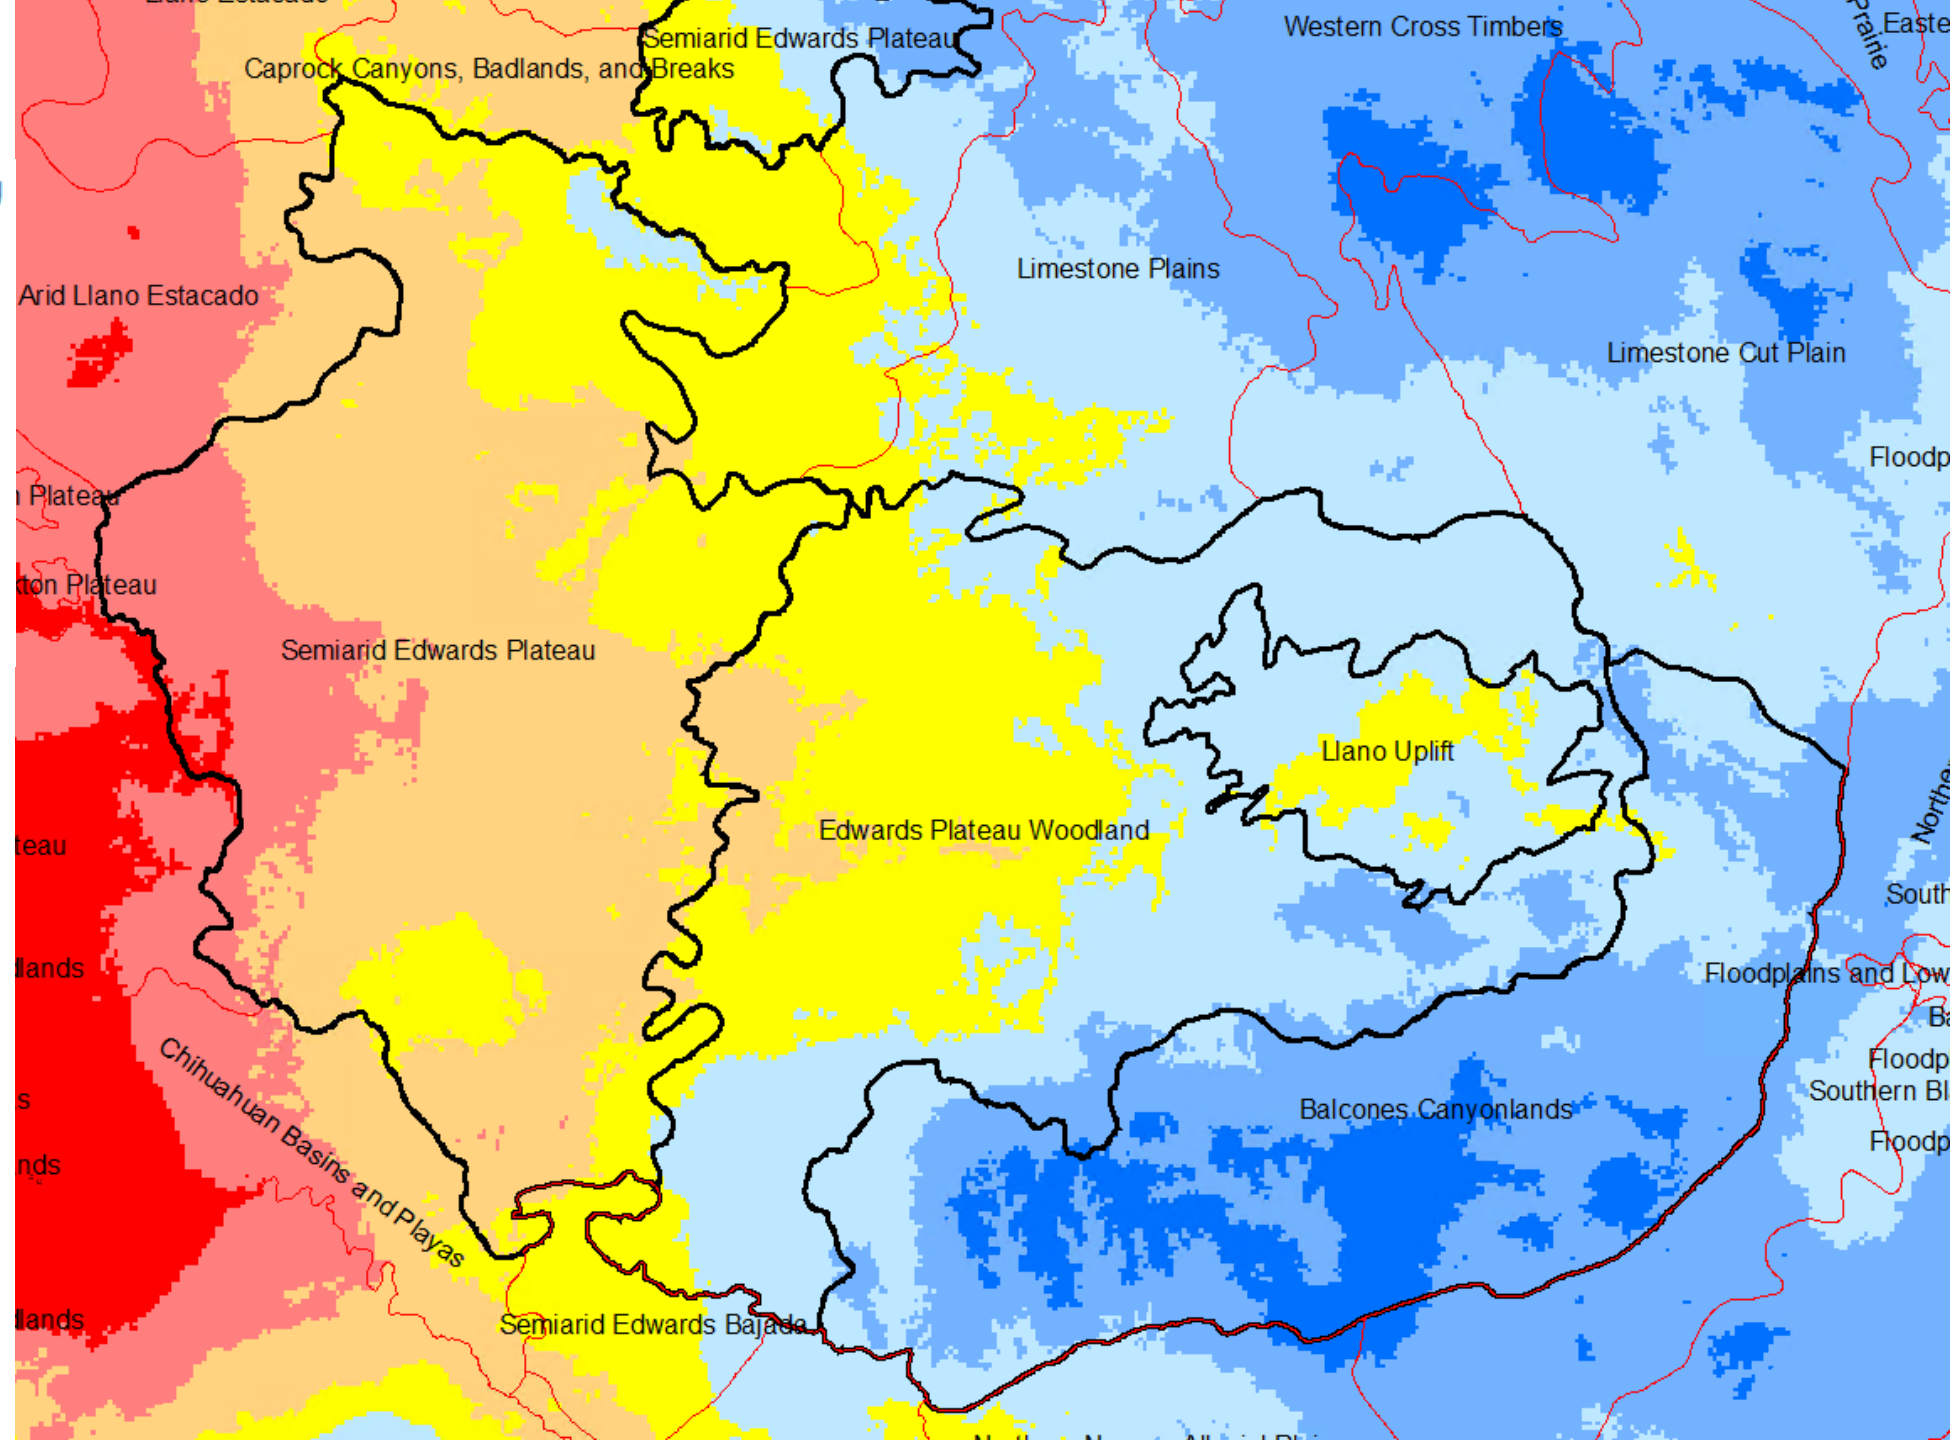

Llano Uplift (pink) is a
topographic basin with acidic
substrate vs limestone for the
other ecoregions (green) so
vegetation is quite different

Summer Precipitation

TX_Daymet_1980_2017_PRCP_SUMMER.img

<VALUE>

Elevation

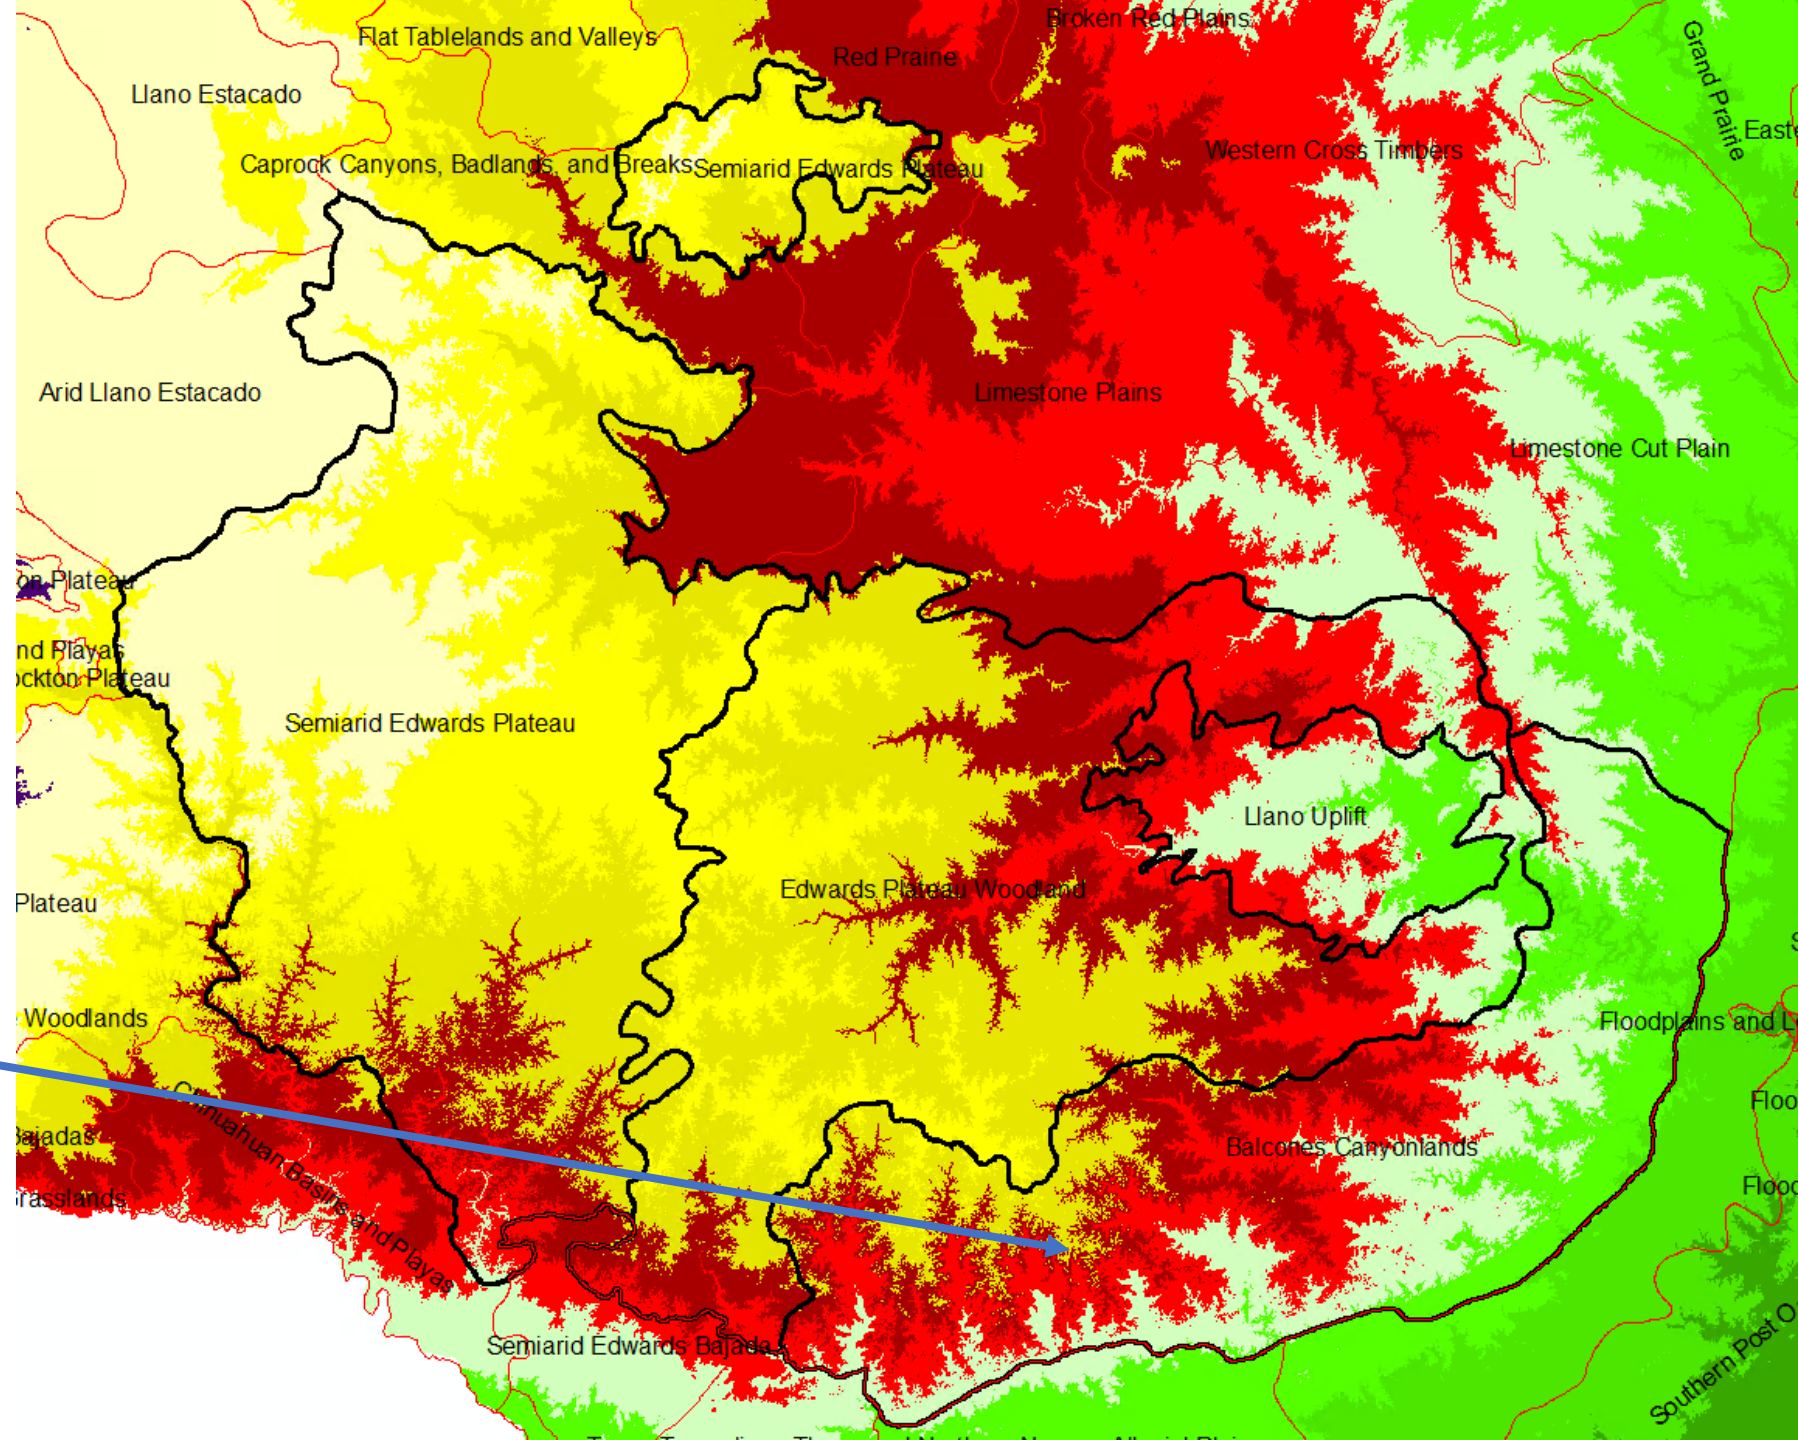

tx_dem_30m.img

<VALUE>

>1000 ft (>300 m) elevation difference across less than 0.5 mile (800 m)

Increased precipitation results from orographic effect – similar patterns occur in the Trans-Pecos mountains

Slopes >20%

EPA Level 4 Ecoregions

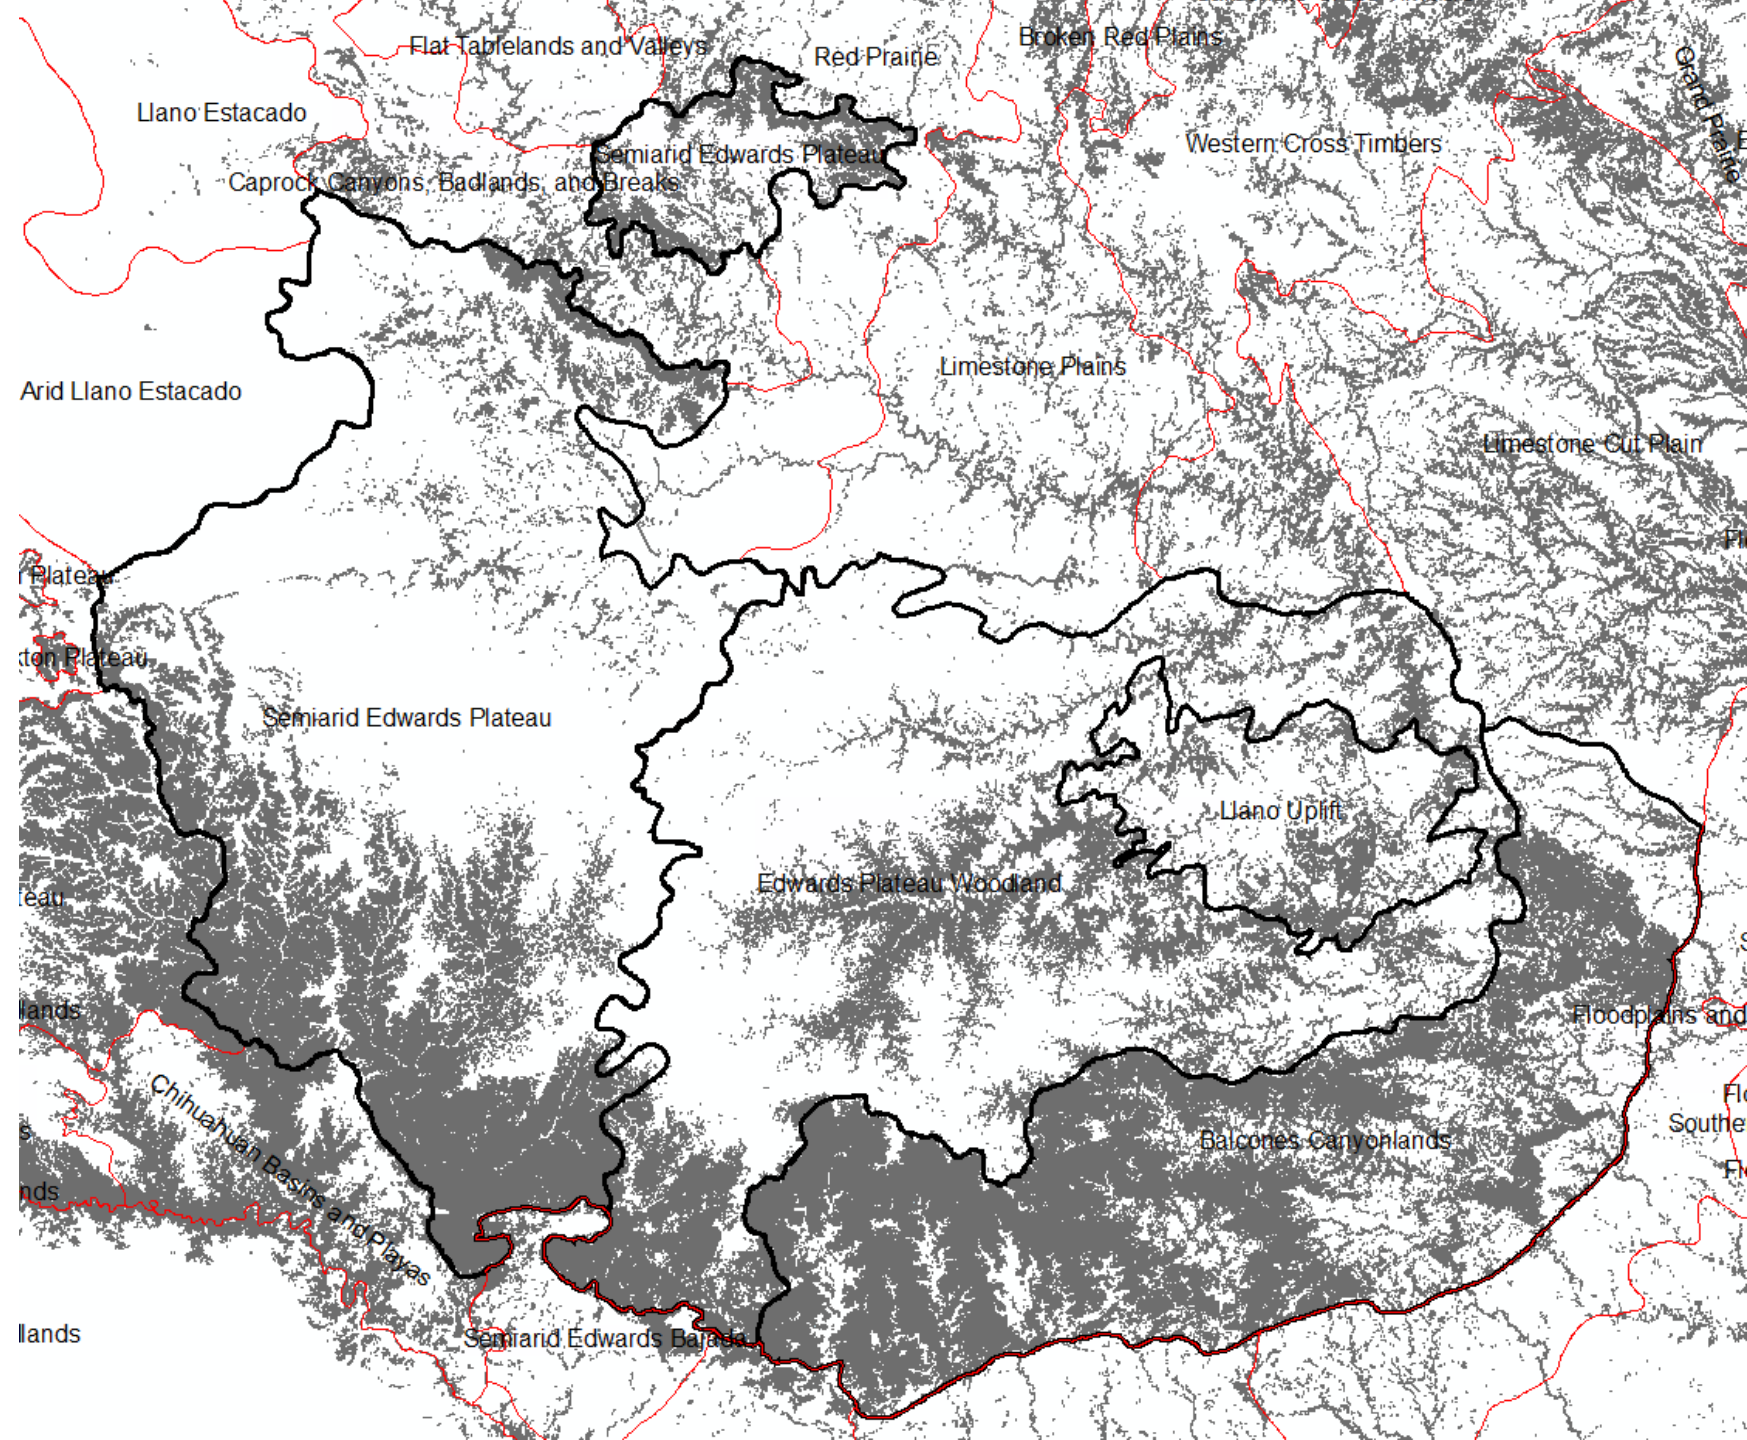

Balcones Canyonlands is wet and rough

Edwards Plateau Woodland is medium-wet and relatively smooth

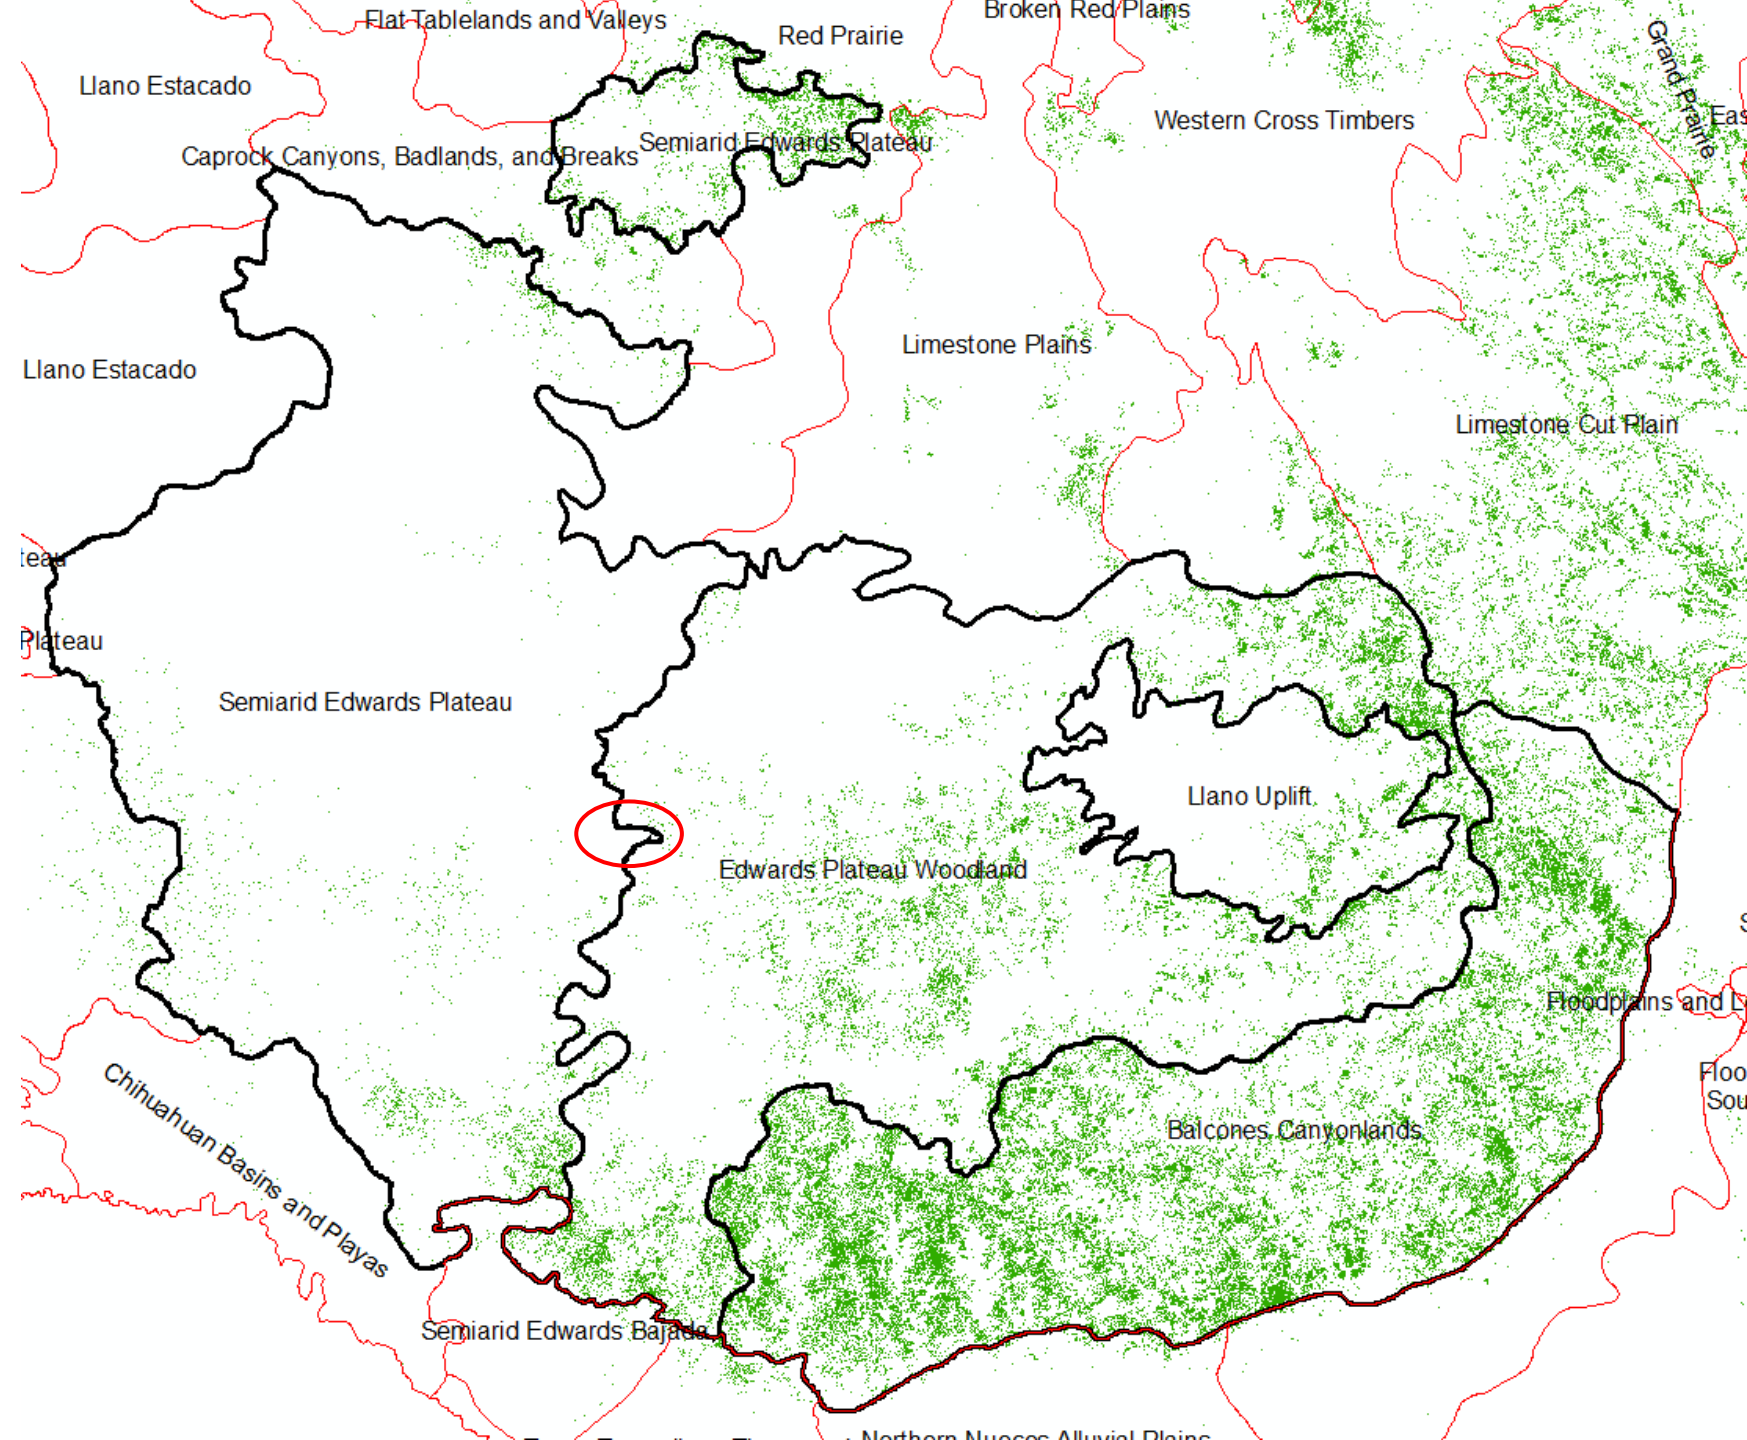

Semi-arid Edwards Plateau is dry

Llano Uplift has different surface geology than other regions

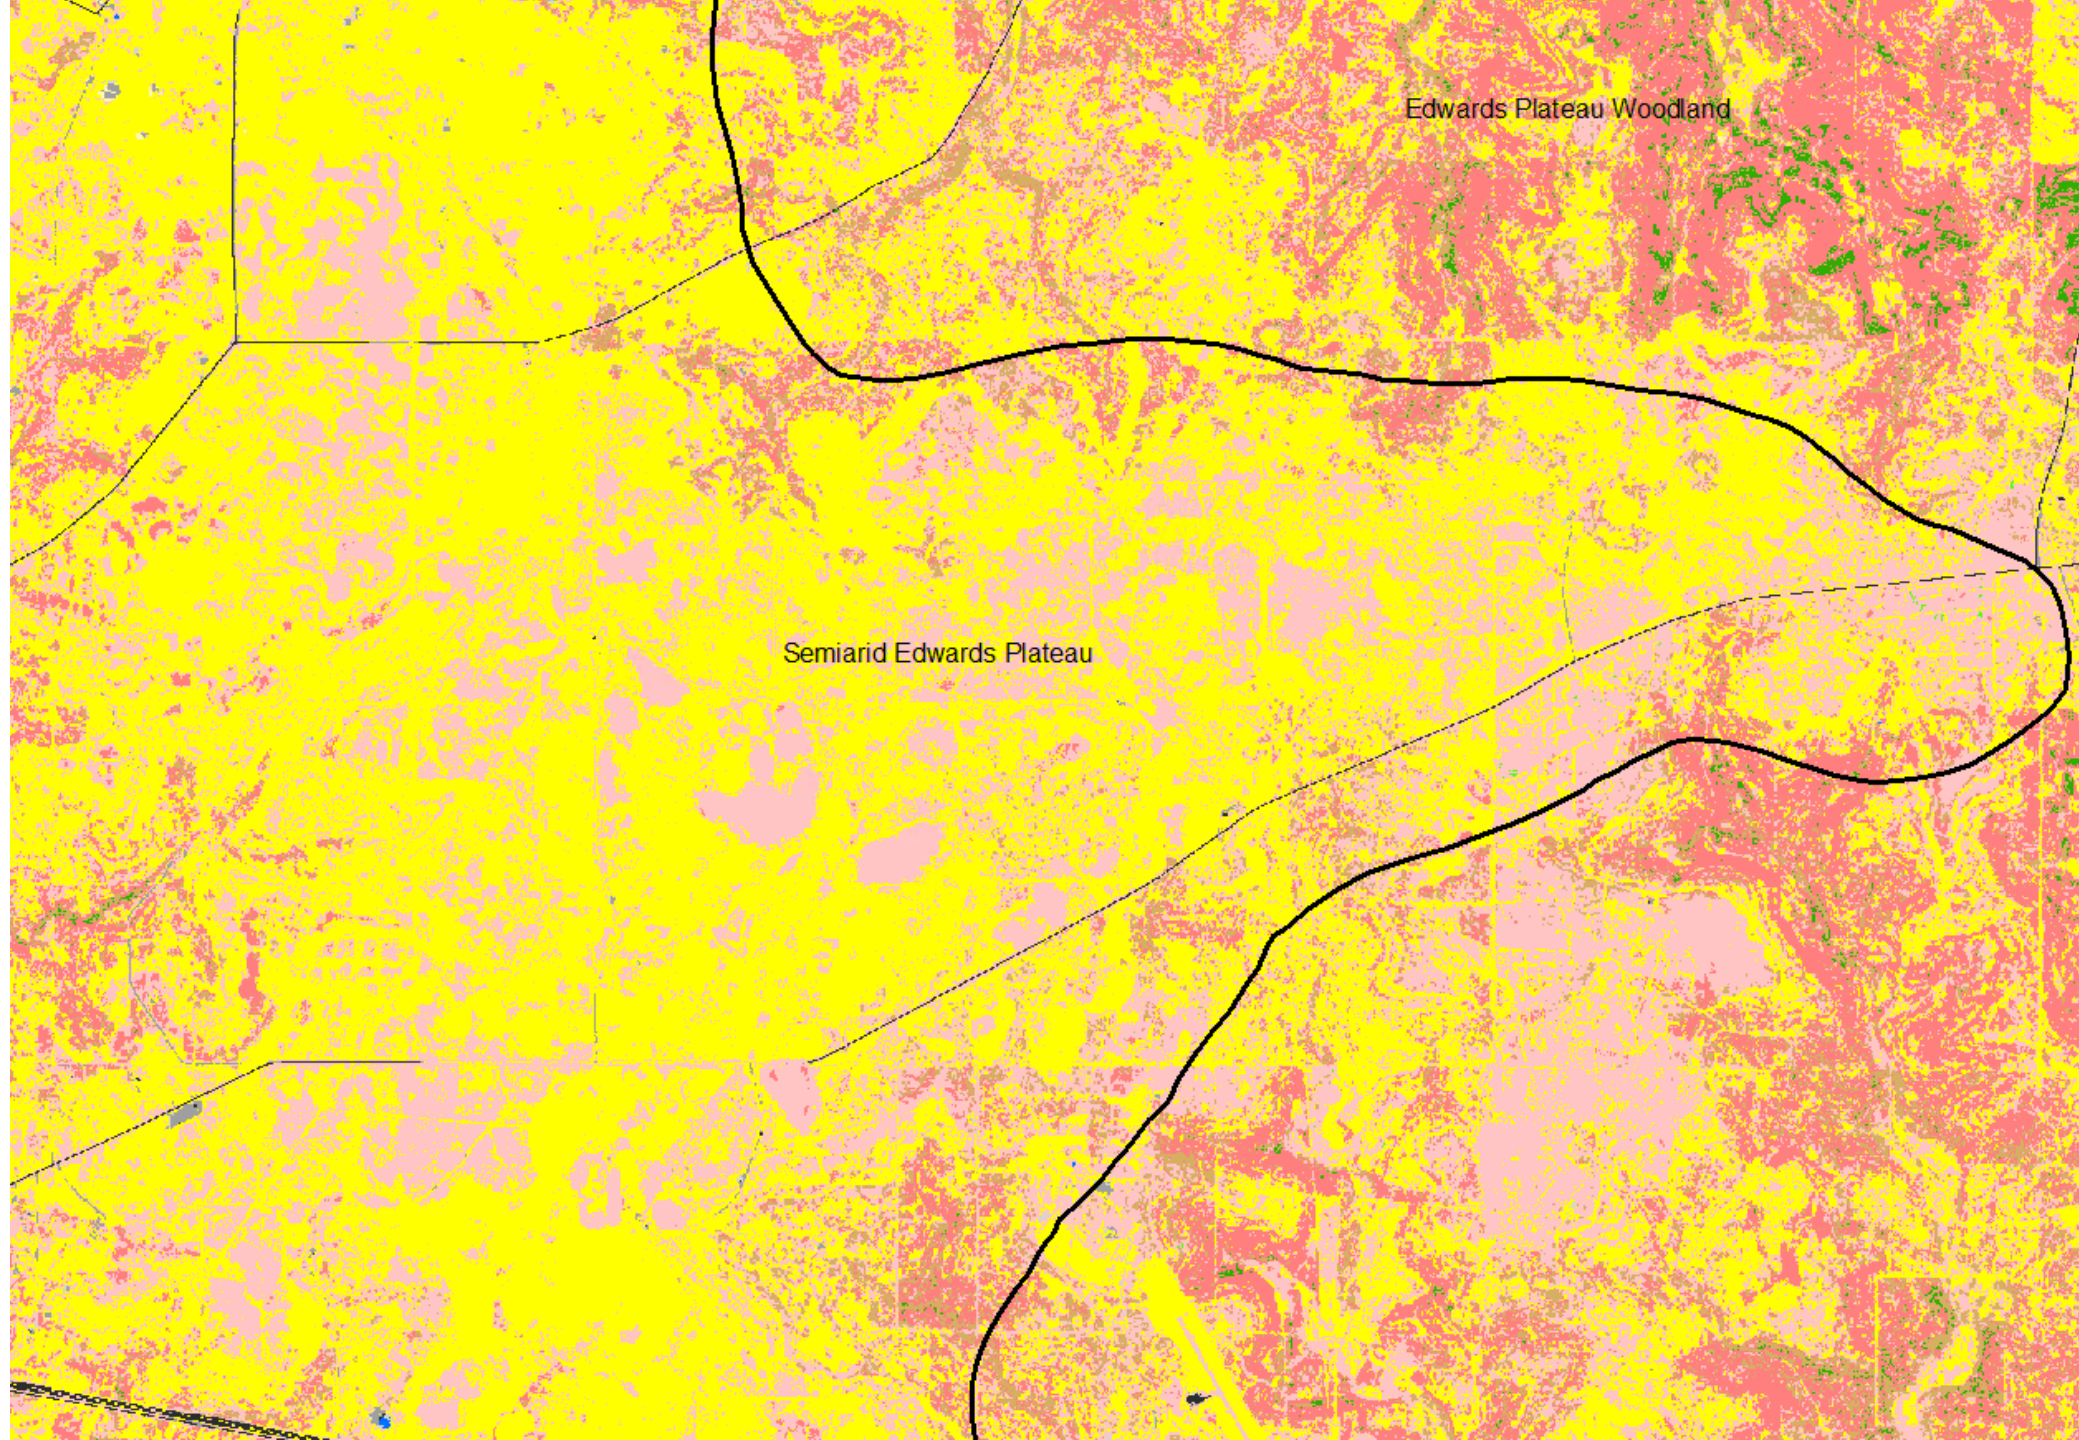

Limestone Cut Plain is similar to the Edwards Plateau

Ashe's Juniper Woodland (green) is in wetter areas, and/or on rougher terrain

- TX_10m_landcover_2021.img
- lulc
- wet herbaceous
- swamp
- shrub swamp
- shinnery oak
- sand sagebrush
- playa (wet)
- playa (dry)
- pine (plantation)
- pine
- pecan orchard
- open water
- mixed pine and deciduous
- herbaceous
- evergreen shrub
- eastern redcedar
- developed wooded
- developed herbaceous
- developed - low intensity
- developed - high intensity
- crop
- coniferous evergreen forest
- cold deciduous shrub
- cold deciduous forest
- coastal algal flat
- citrus
- broadleaf evergreen forest
- barren

Edwards Plateau Woodland

Semi-arid Edwards Plateau

Ashe's Juniper is only moderately drought-tolerant

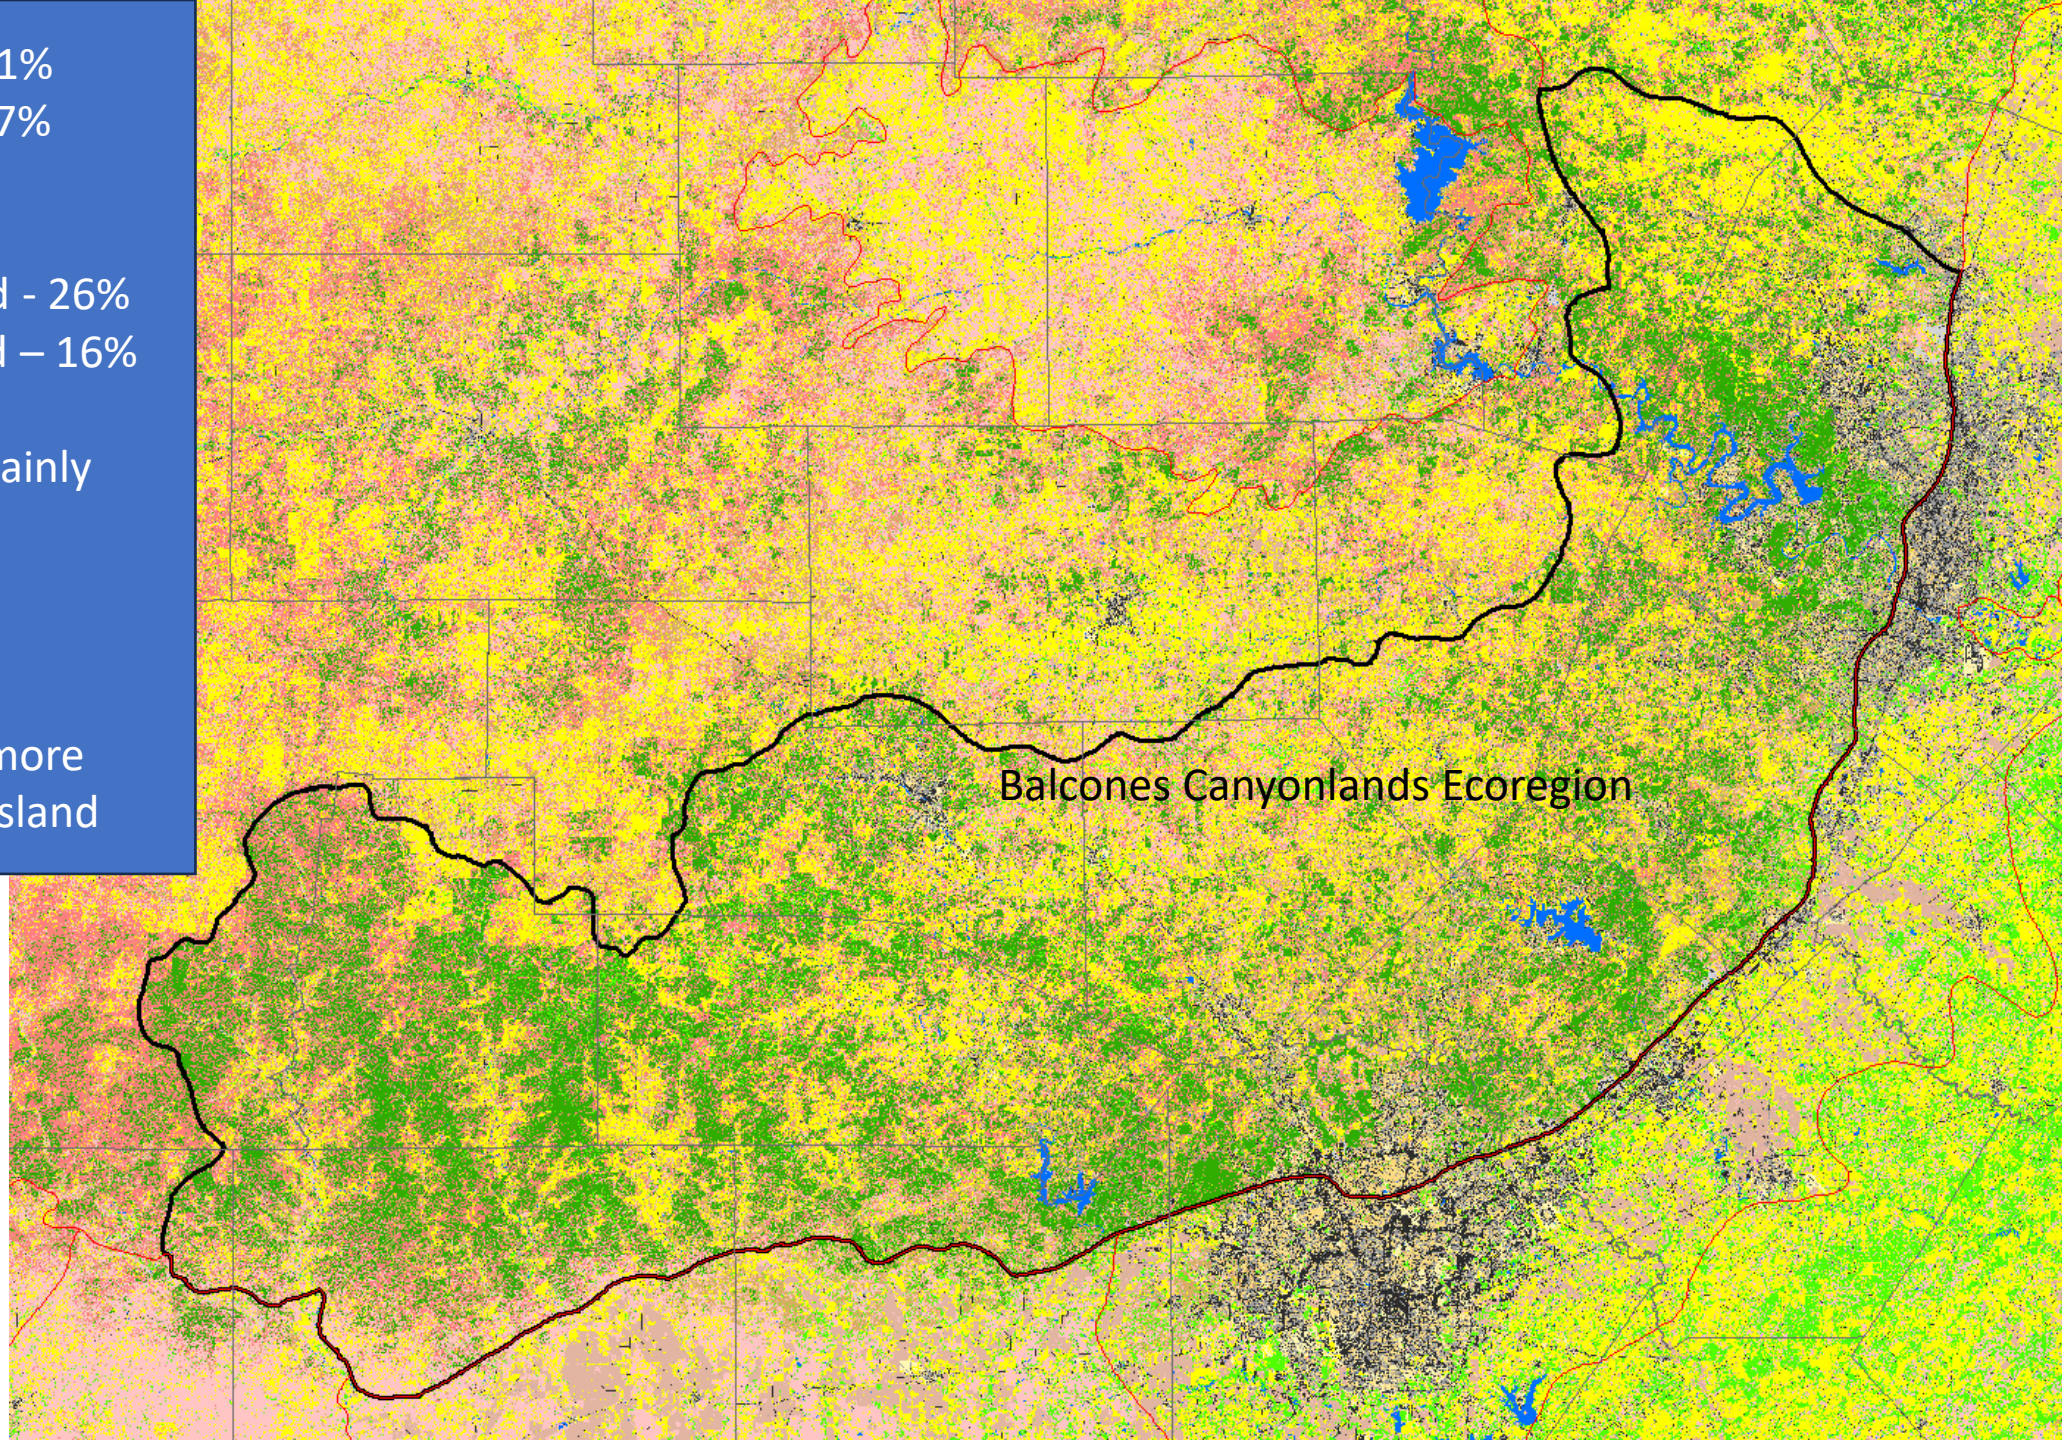

Woodland (all types) – 41%
Shrubland (all types) – 27%
Grassland cover - 21%

Ashe's Juniper Woodland - 26%
Ashe's Juniper Shrubland – 16%

Deciduous Shrubland (mainly
shin oak) – 11%

Urban cover – 9%

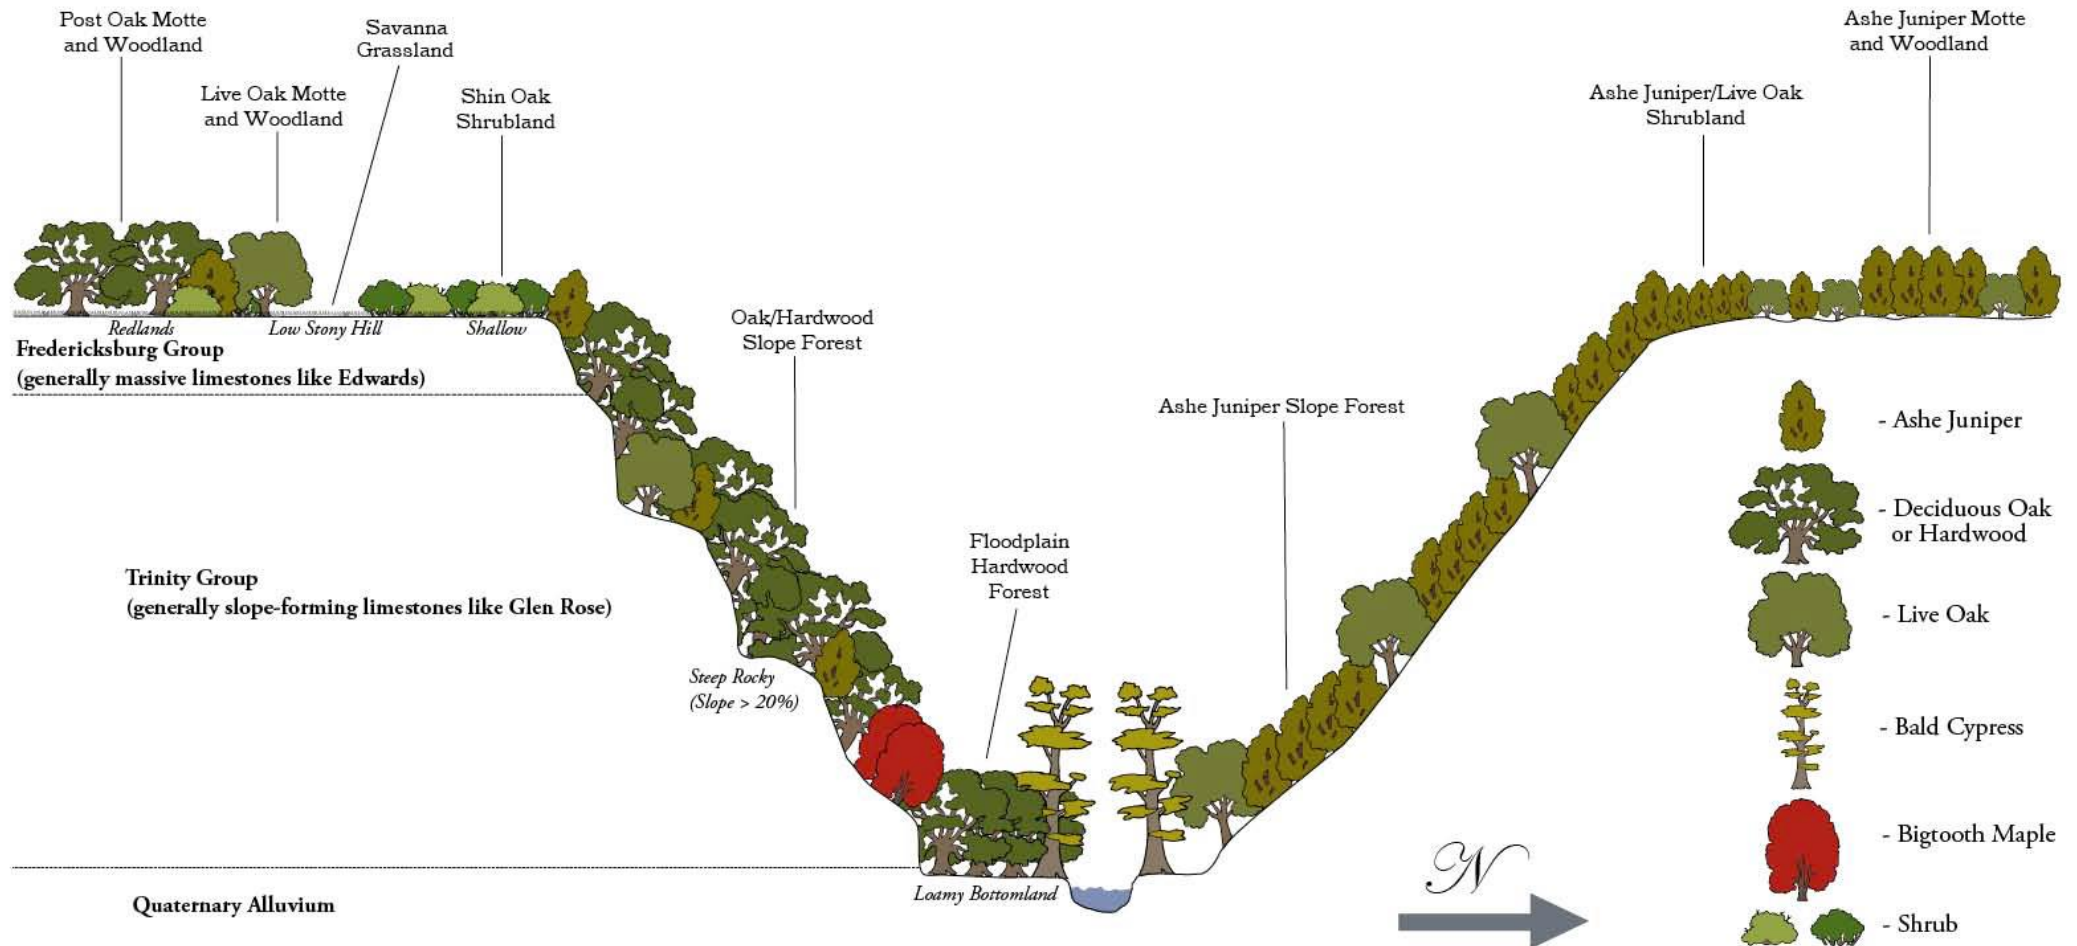

Slopes >20 degrees: 6X more
forest; half as much grassland

Balcones Canyonlands Ecoregion

Conceptual Balcones Canyonlands Landscape – TPWD Landscape Ecology Program, 2014

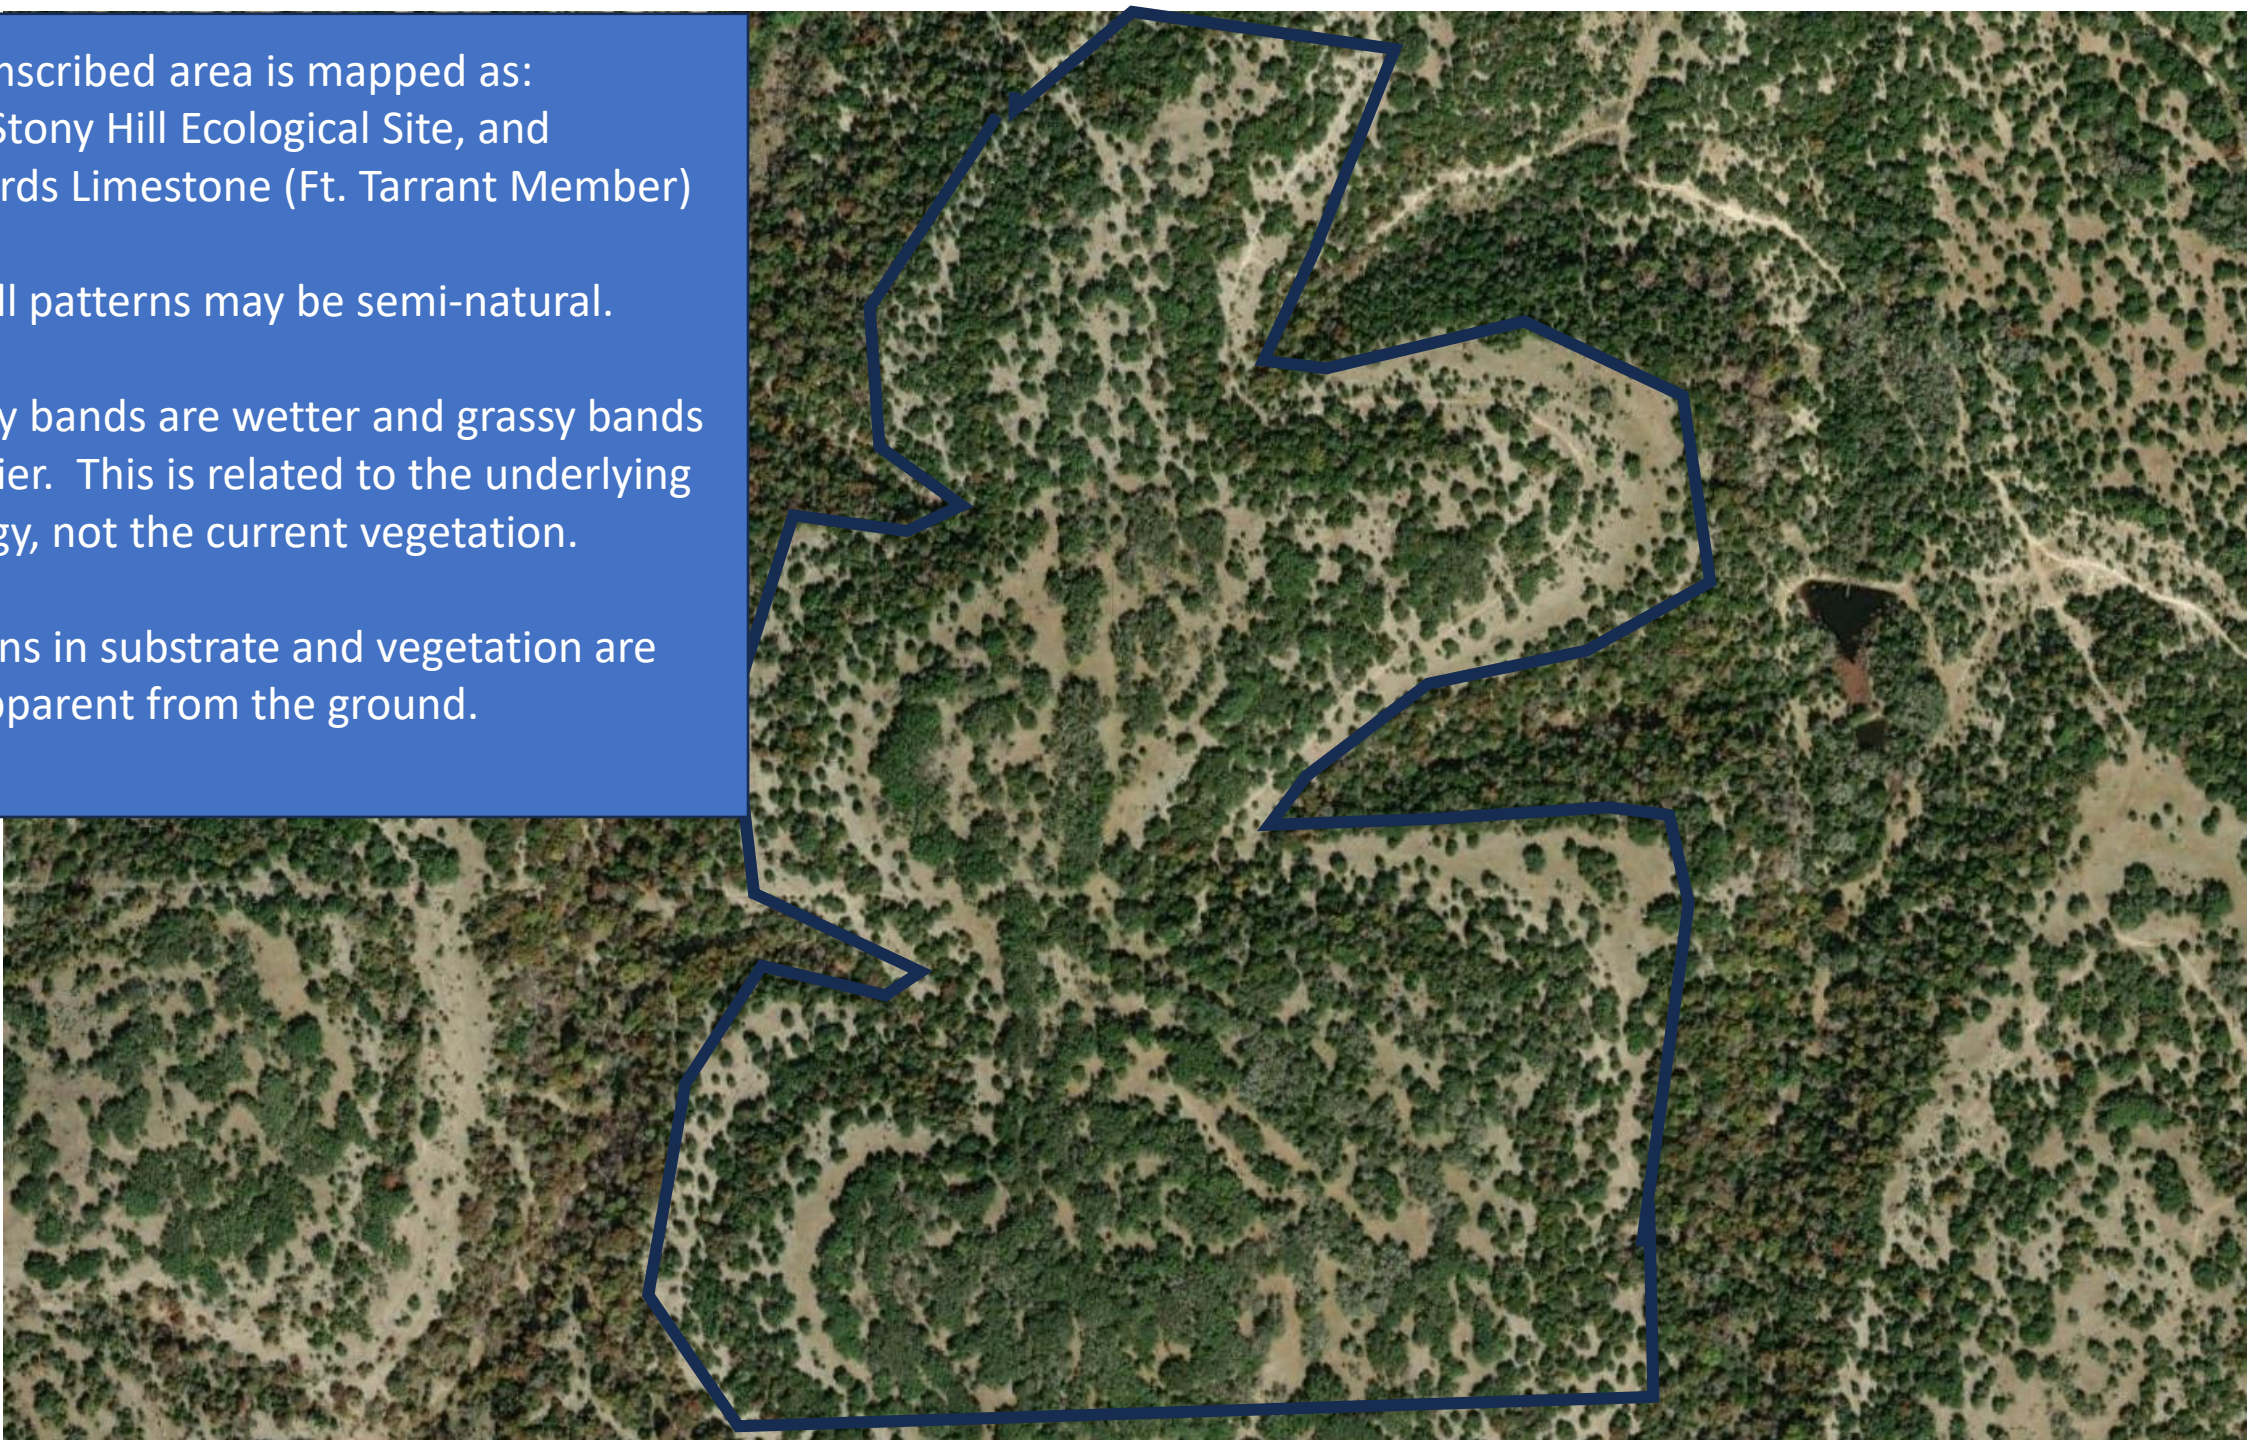

Local landform, geology, and soils influence current vegetation (in addition to management)

Circumscribed area is mapped as:
-Low Stony Hill Ecological Site, and
-Edwards Limestone (Ft. Tarrant Member)

Overall patterns may be semi-natural.

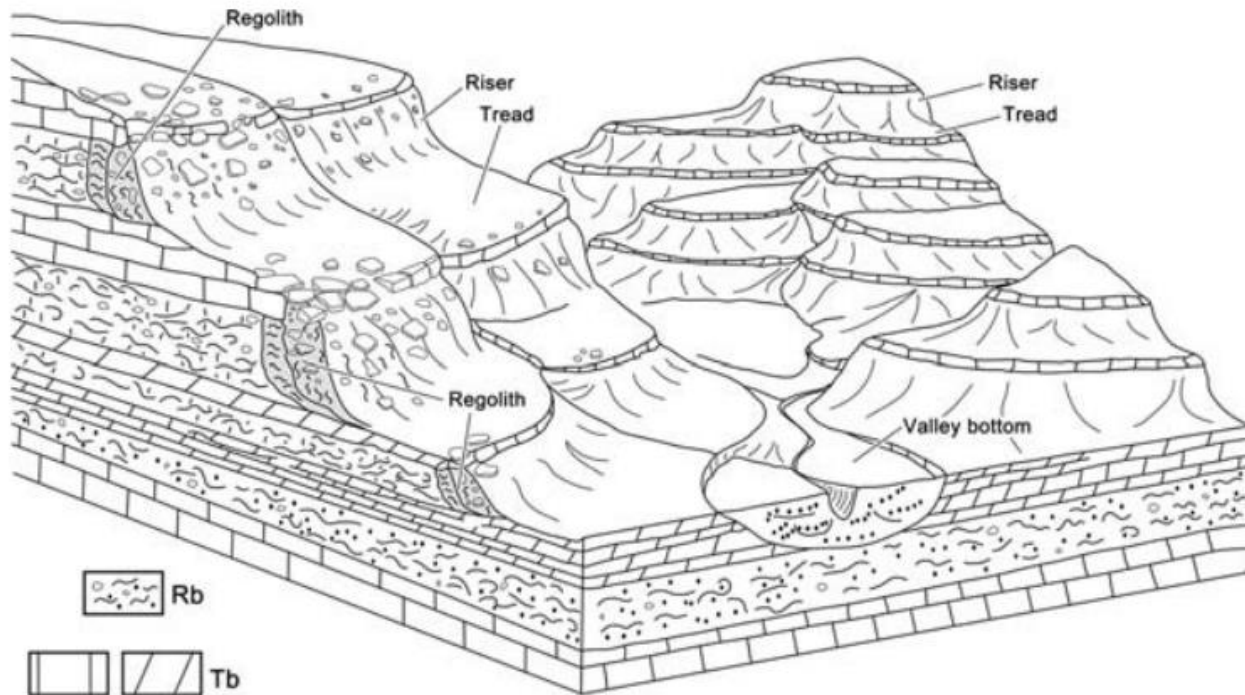

Woody bands are wetter and grassy bands are drier. This is related to the underlying geology, not the current vegetation.

Patterns in substrate and vegetation are not apparent from the ground.

Bedrock, soils, and hillslope hydrology in the Central Texas Hill Country, USA: implications on environmental management in a carbonate-rock terrain

C. M. Woodruff Jr · L. P. Wilding

	Mapped Type Name	Field Samples	Area (Ha)

From TPWD Landscape Ecology Program

East to West and North to South variation in the vegetation exists

Mapped Type Name	Mapped Type Brief Description	Field Samples	Area (Ha)
Edwards Plateau: Savanna Grassland	Grassland condition varies for this mapped type, but many areas contain non-native King Ranch bluestem as an important species, and Bermudagrass is also frequent. Common native grasses include little bluestem, sideoats grama, silver bluestem, Texas wintergrass, purple three-awn, and common curlymesquite. Trees and shrubs are usually present, and may include plateau live oak, Ashe juniper, mesquite, agarito, and/or cedar elm.	389	1,877,860
Edwards Plateau: Ashe Juniper-Live Oak Shrubland	Ashe juniper and plateau live oak are the most frequent dominants of this evergreen shrubland. Plateau live oak and/or Ashe juniper may form a sparse canopy and Vasey oak (west), white shin oak, Mohr's shin oak (west), agarito, Texas persimmon, Texas mountain-laurel, mesquite, Lindheimer's pricklypear may be common in the understory.	284	1,268,470
Edwards Plateau: Live Oak Motte and Woodland	Plateau live oak alone or with Ashe juniper usually dominates the overstory of this type. Deciduous trees such as cedar elm, sugar hackberry, white shin (or Vasey) oak, Lacey oak, and Texas oak may be components. Shrubs such as mesquite, Texas persimmon, and agarito are common.	165	760,740
Edwards Plateau: Juniper Semi-arid Shrubland	Redberry juniper and Ashe juniper may both be present in this type, together with species such as plateau live oak, mesquite, Texas persimmon, Lindheimer pricklypear, Texas sotol, and agarito. Important grasses may include sideoats grama, purple threeawn, curlymesquite, slim tridens, hairy tridens, and Texas wintergrass.	105	697,806

Edwards Plateau Dry-Mesic Slope Forest and Woodland

Nature Serve ID: CES303.656

Geology

Found on limestone (primarily Cretaceous or Pennsylvanian) slopes within the Edwards Plateau and adjacent ecoregions, including the Carbonate Cross Timbers in the Palo Pinto County area and the Callahan Divide. Cuestas of Cretaceous chalk in the Blackland Prairie and calcareous slopes of the Crosstimbers may also be occupied by this system.

Landform

Slopes generally greater than 20 percent.

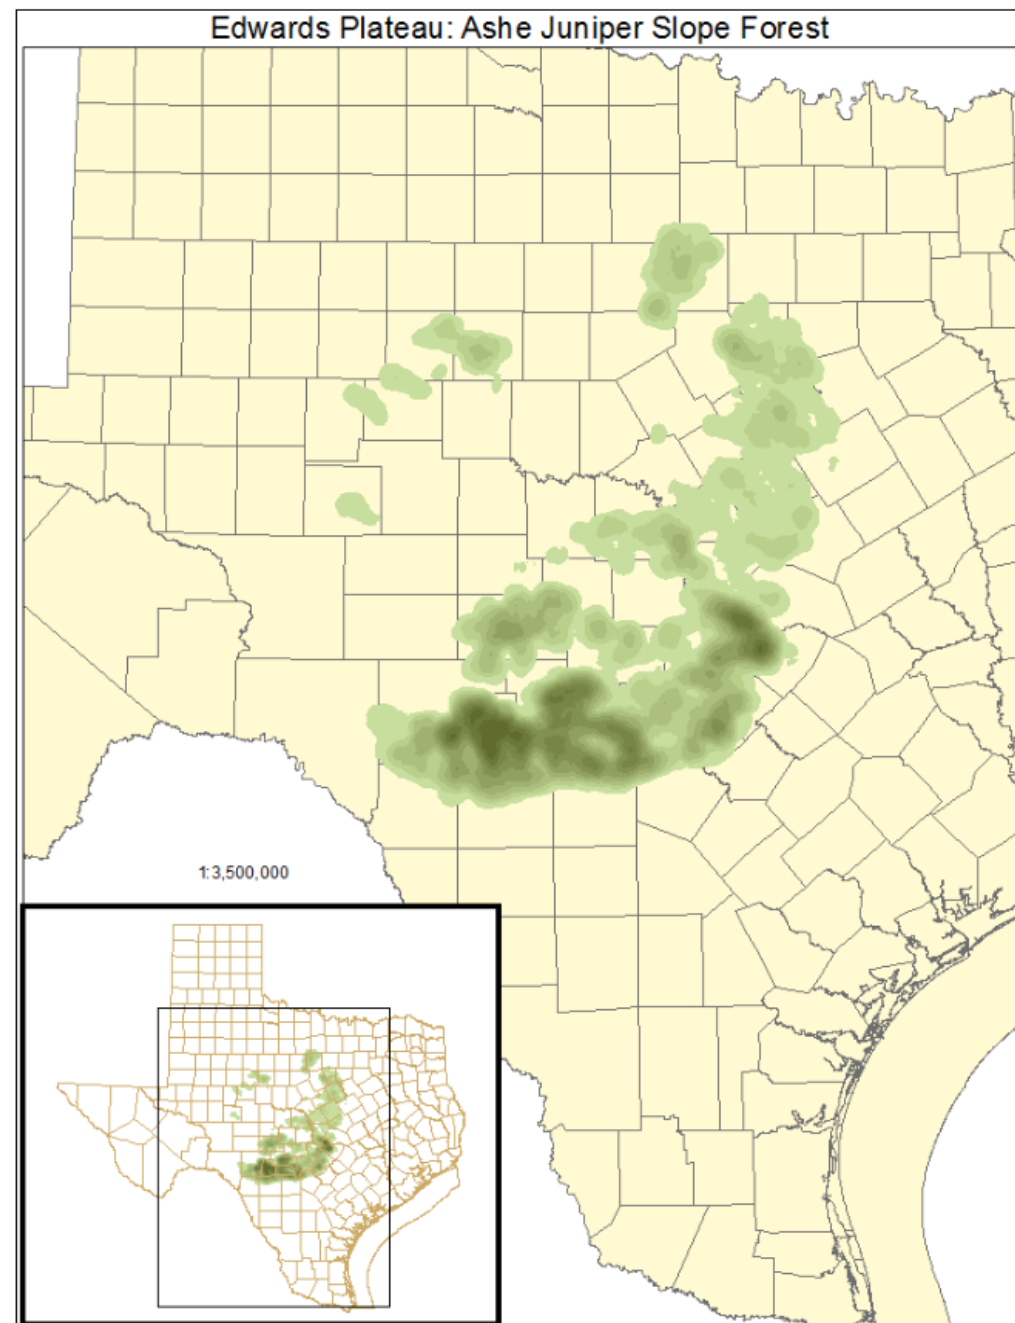

Soils

Stones and boulders are conspicuous on the soil surface. Soils are generally dark clay to clay loam and shallow. Steep Rocky and Steep Adobe Ecological Sites may be associated with this system.

Parent Description

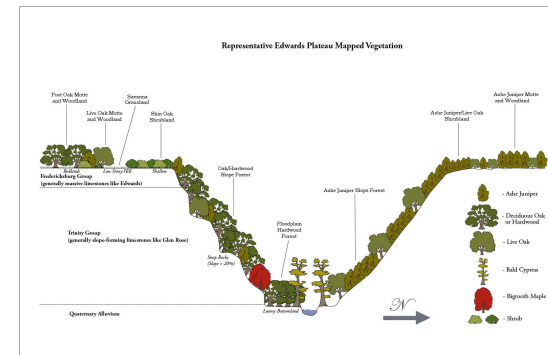

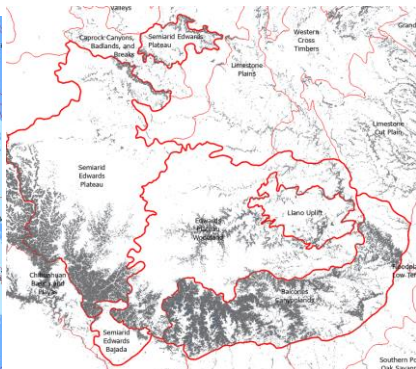

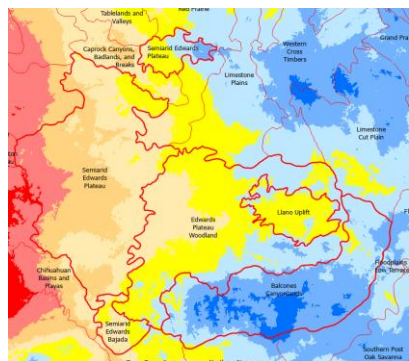

This system occurs on dry to mesic, middle slopes of the rolling uplands and escarpments of the Edwards Plateau and similar sites. The canopy is typically dominated or co-dominated by deciduous trees, including *Quercus buckleyi* (Texas oak), *Quercus laceyi* (Lacey oak), *Quercus sinuata* var. *breviloba* (white shin oak), *Fraxinus texensis* (Texas ash), *Ulmus crassifolia* (cedar elm), *Prunus serotina* ssp. *eximia* (escarpment black cherry), *Juglans major* (Arizona walnut), and/or *Celtis laevigata* var. *reticulata* (netleaf hackberry). *Quercus fusiformis* (plateau live oak) and *Juniperus ashei* (Ashe juniper) are often present and are sometimes co-dominant with deciduous species of this system. Canopy closure is variable, and this system can be expressed as forests or woodlands. The shrub layer may be well-represented, especially where the overstory canopy is discontinuous. Species such as *Aesculus pavia* var. *flavescens* (red buckeye), *Cercis canadensis* var. *texensis* (Texas redbud), *Forestiera pubescens* (elbowbush), *Ungnadia speciosa* (Mexican buckeye), *Ceanothus herbaceus* (Jersey tea), *Frangula caroliniana* (Carolina buckthorn), *Sophora secundiflora* (Texas mountain-laurel), *Viburnum rufidulum* (rusty blackhaw), *Rhus* spp. (sumac), *Vitis* spp. (grape), and *Garrya ovata* (silktassel) may be present in the shrub layer. With the large amount of exposed rock, frequent accumulation of leaf litter, and significant canopy closure, herbaceous cover is generally sparse, with *Carex planostachys* (cedar sedge) often present. Woodland forbs such as *Tinantia anomala* (widowsteers), *Chaptalia texana* (silver-puff), *Nemophila phacelioides* (baby blue-eyes), *Salvia roemeriana* (cedar sage), *Lespedeza texana* (Texas lespedeza), and various ferns may also be present, if patchy. Grasses such as *Schizachyrium scoparium* (little bluestem) and *Bouteloua* spp. (gramas) may occur, typically scattered and patchy.

Distribution Map

Vegetation Pattern Summary

- The Edwards Plateau is drier, with fewer woodlands and more grassland and shrubland to the west
- The Balcones Canyonlands is the wettest sub-division of the Edwards Plateau, is rugged, and therefore is the most wooded ecoregion
- Locally, landform, geology, and soils influence vegetation patterns, in addition to management
- Fine-resolution variation in geology and soils are often not mapped
- Species composition varies from east to west, and north to south
- *“All generalizations are dangerous, even this one.” – Alexander Dumas*

Balcones Canyonlands Pre-European Vegetation Patterns

Unknowable, in a quantitative sense; **patchy, diverse and easy to over-generalize**

Most steep slopes were woodland or forest, and were protected from fire for decades at least, possibly centuries

Uplands were likely a mosaic of woodland, shrubland, and grassland, but probably more wooded than grassy, same as in the modern landscape

Major woody components:

- Ashe's juniper
- Texas live oak
- Texas red oak
- Shin oak

Diamond and True, 2008. Distribution of *Juniperus* woodlands in central Texas in relation to general abiotic site type.

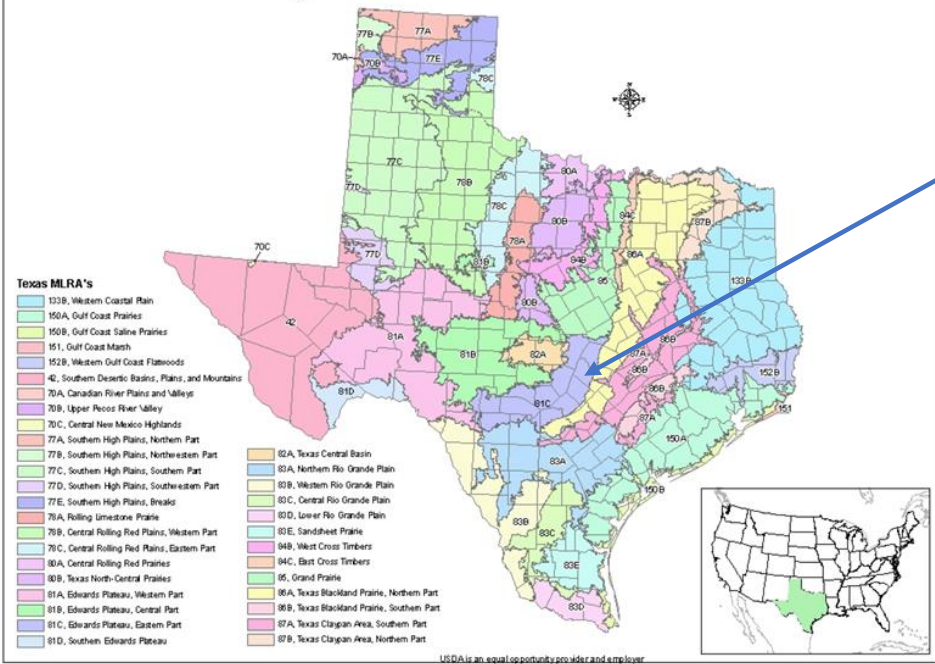

“Overall changes in land cover have not been dramatic since European settlement, despite long-term attempts to reduce Ashe’s juniper cover Management regimes related to abiotic site types and current conditions should be adopted.”

The most significant invasive species of grasslands is Yellow (King Ranch) Bluestem; Chinaberry is most widespread invasive species of woodlands, and other species may spread from urban areas

Urban (9%) is largest non-natural landcover class and has about doubled since 2008; this is quite “dramatic”

State and Transition

Models: concept is that transitions within a box are easy, but between boxes hard

Over-generalization: conceptual description cannot capture spatial variation on the ground

Herbaceous component is over-emphasized in this region

Soils can be mis-mapped

Soils by ECOCLASSID (Ecological Site Type)

Soil mapping is inconsistent and imprecise; mis-matches at county lines are common and impossible to correct

Other geophysical datasets can be used to help map vegetation and guide management

Helpful New Geophysical Setting Information

- Categorical Datasets
 - Hammond-style landforms (coarser than soils maps)
 - Surface geology (coarse, but appealing)
 - Sayre-style ecosystems maps (coarser than soils but appealing)
 - ALOS (combines heat load -slope/exposure- and land position into 15 classes)
 - Geomorphons (pattern recognition/viewshed-based, output 10 class landform model)
- Continuous Datasets
 - Percent slope (calculated from difference between high and low within a neighborhood)
 - Roughness (difference between high and low within a neighborhood)
 - Solar radiation (solrad; integrates slope, exposure (N/S), and shading)
 - Topographic wetness indices (TWI, TMI, WILT)
 - Flow accumulation
 - SMAP (from Remote Sensing and hydrologic modeling)
 - POLARIS (soil variables modeled from terrain using gSSURGO training)

Topographic
Wetness Index

Red is wetter

Use of New Geophysical Datasets

- Many exist and have been used for mapping and management
- Can be fine-resolution and accurate, with appealing visual presentation
- Use can be challenging
 - Accessibility
 - Interpretation of ecological meaning
- **Application for mapping and management on the Edwards Plateau is doable**

“The picture’s pretty bleak gentlemen ...
The world’s climates are changing, the
mammals are taking over, and we all have
a brain about the size of a walnut.”

“The picture’s pretty bleak, gentlemen. ... The world’s climates are changing,
the mammals are taking over, and we all have a brain about the size of a walnut.”
